## **FIELD OF THE INVENTION**

The present invention relates to inhibition of growth factor tyrosine kinase receptor activity, particularly inhibition of angiogenesis and related disorders, tumor progression and growth factor-related skeletal disorders, by porphyrin and corrole compounds, and to certain novel porphyrin compounds.

**ABBREVIATIONS:** AP, alkaline phosphatase; EGF, epidermal growth factor; bFGF, basic fibroblast growth factor; FGF, fibroblast growth factor; FGFR, FGF receptor; FGFR-1, FGF receptor-1; FGFR-3, FGF receptor-3; FRAP, FGFR-1-alkaline phosphatase fusion protein; FR3-AP, FGFR-3-alkaline phosphatase fusion protein; HB-EGF, heparin-binding EGF-like growth factor; HGF, hepatocyte growth factor; HSPG, heparan sulfate proteoglycans; IGF, insulin-like growth factor; LLC, Lewis Lung Carcinoma; NGF, nerve growth factor; PDGF, platelet-derived growth factor; SMC, smooth muscle cells; TKR, tyrosine kinase receptor; VEGF, vascular endothelial growth factor; VSMC, vascular smooth muscle cells.

## **BACKGROUND OF THE INVENTION**

Growth factors play a pivotal role in the multistep pathway of cell differentiation and migration, tumor and metastasis progression, and angiogenesis.

The pathological mechanism of many proliferative diseases is determined by biological events such as growth factor receptor stimulation, autophosphorylation, and the phosphorylation of intracellular protein substrates.

Phosphorylation of tyrosine residues on protein substrates in normal cells serves a critical function in intracellular growth signaling pathways initiated by stimulated extracellular growth factor receptors. Growth factors such as fibroblast growth factor (FGF), epidermal growth factor (EGF), platelet-derived growth factor (PDGF), nerve growth factor (NGF), vascular endothelial growth factor (VEGF) and hepatocyte growth factor (HGF), associate with their respective extracellular receptors thus activating the intracellular tyrosine kinase domains of said receptors and catalyzing the phosphorylation of the receptors themselves (autophosphorylation) or of intracellular substrates. This association between the growth factor ligand and the

respective receptor stimulates tyrosine kinase activity as one of the initial biochemical events leading to DNA synthesis and cell division. Therefore, compounds which inhibit protein tyrosine kinases associated with intracellular growth factor signal transduction pathways may be useful for the treatment of cellular proliferative disorders.

Fibroblast growth factors (FGFs) are abundant in normal and malignantly transformed cells and play a pivotal role in the multistep pathway of malignant transformation, tumor progression, metastasis and angiogenesis. In adults, bFGF, as well as the FGF oncogenes HST (FGF-4) and int-2 (FGF-3) are found in tumors such as stomach cancer, Kaposi's sarcoma, melanoma and breast cancer.

FGFs bind avidly to the glycosaminoglycan heparin and to heparan sulfate proteoglycans (HSPG) found on cells and in the extracellular matrix. Studies on the mode of action of FGFs identified a novel role for heparin-like molecules in the formation of distinct FGF-heparin complexes that are essential for binding of FGF to its cognate receptor (Yayon et al, 1991; Rapraeger et al, 1991). We and others have recently addressed the importance of specific heparin and heparan sulfate structures in FGF receptor binding activity (Guimond et al, 1993; Aviezer et al, 1994a) and have demonstrated that specific HSPGs such as perlecan, function as a low affinity, accessory receptor for bFGF and as a potent angiogenic modulator (Aviezer et al, 1994b).

FGF receptors were found to play a role in genetically acquired growth disorders. Thus, a number of mutations in FGF receptors have been implicated in various forms of human skeletal dysplasias. For instance, achondroplasia, the most common form of human dwarfism, is caused by a specific mutation in the transmembrane domain of FGFR-3 (Rousseau et al, 1994 ; Shiang et al, 1994). Other skeletal disorders such as Crouzon's syndrome and thanatophoric dysplasia, involve mutations in the extracellular domain (Reardon et al, 1994) or the kinase domain of FGF receptors. In achondroplasia, a point mutation (Gly380/Arg) in the transmembrane domain of FGFR-3 leads to impaired growth. Since we have identified FGF-9 as a putative ligand for FGFR-3 (Hecht et al, 1995), it is conceivable that strategies aimed at check points along the biochemical mechanism of the FGFR-3 activation pathway, may result in treatment of achondroplasia. Naski et al, 1996, have demonstrated that both the achondroplasia and thanatophoric dysplasia

mutations constitutively activate the receptor as evidenced by receptor tyrosine phosphorylation. These findings have been biologically supported by knock out of the FGFR-3 gene (Deng et al, 1996). Furthermore, it seems that FGFRs are involved in bone and cartilage benign tumors, such as hereditary multiple exostosis, osteoarthritis and others. Exostosis is an osteochondrogenous benign tumor of an autosomal dominance, diversified phenotype and heterogeneous genetics characterized by the formation of cartilaginous capped metaphyseal bony protrusions.

Vascular endothelial growth factor (VEGF) is a known endothelial mitogen and a potent enhancer of vascular permeability. VEGF is a multifunctional cytokine that exerts *in vivo* a key role in physiological and pathological neoangiogenesis by stimulating endothelial cell proliferation and vessel hyperpermeability. VEGF exists as one of four different isoforms, respectively, VEGF 121, VEGF 165, VEGF 189, and VEGF 206. VEGF121 does not bind heparin while the other three isoforms do, and it has been documented that the binding of VEGF165 to its receptor is dependent upon cell surface heparin sulfate proteoglycans (Gitay-Goren et al, 1992). VEGF binds to Flt-1 and Flk-1/KDR cell membrane receptors which are members of the tyrosine kinase receptor family. VEGF seems to be a crucial mediator of physiological neoangiogenesis during the embryonic development and the female cycle.

VEGF also has a major role in the pathogenesis of many diseases including hypervascularized tumors, rheumatoid arthritis, cutaneous diseases and proliferative retinopathies. VEGF gene expression *in vitro* is enhanced approximately ten times by hypoxia. Current evidence (Patt et al, 1998) suggests that hypoxia is also the driving force for VEGF gene expression in cells *in vivo* and represents the most important trigger for tumor angiogenesis and edema. Recent approaches to inhibit tumor angiogenesis and metastasis formation concentrate on the disruption of VEGF/VEGF receptor signal transduction pathway *in vivo*. Persistent angiogenesis may cause or exacerbate certain diseases such as psoriasis, rheumatoid arthritis, hemangiomas, angiofibromas, diabetic retinopathy and neovascular glaucoma. An inhibitor of VEGF activity would be useful as a treatment for such diseases and other VEGF-induced pathological angiogenesis and vascular permeability conditions, such as tumor vascularization.

The EGF receptor, which main ligands are EGF, HB-EGF and transforming growth factor  $\alpha$  (TGF- $\alpha$ ), is involved in the disease processes of many malignant

tumors, especially colon and breast cancers. Overexpression and mutation of the closely related Erb-2 and Erb-3 receptors have been shown to be the major risk factors in poor prognosis of breast cancer. HB-EGF is a most potent activator of the EGF receptor on smooth muscle cells (SMC), including VSMC, playing a crucial role in the pathogenesis of atherosclerosis and benign hypertrophy of the uterus and the formation of leiomyomas (tumors composed of nonstriated muscular tissue).

PDGF has been identified as a potent endogenous vascular smooth muscle cells (VSMC) mitogen and chemoattractant. Proliferation and directed migration of VSMC are important elements in processes such as vascular remodeling, atherosclerosis and restenosis. In balloon-injured rat model, elevated vascular mRNA expression of PDGF A and B chains and PDGF receptors has been observed in carotid arteries (J. Cell Biology, 1990, 111: 2149-2158) and infusion of PDGF greatly increased intimal thickening and migration of VSMC (J. Clin. Invest. 1992, 89: 507-511).

Hepatocyte growth factor (HGF), also known as scatter factor (SF), is the prototype of a family of structurally related soluble molecules (scatter factors), which also includes the HGF-like/macrophage-stimulating protein (HGF1/MSP). HGF and HGF1/MSP control a complex genetic program known as 'invasive growth' which leads to cell dissociation, proliferation, invasion of extracellular matrix, prevention of apoptosis, acquisition of polarity and tubule formation. HGF is synthesized by mesenchymal cells and is a paracrine effector of cells, predominantly epithelial, that express the Met tyrosine kinase receptor. The HGF and HGF1/MSP receptors are the tyrosine kinases encoded by the homologous genes *met* and *ron*. During development, coordinated control of invasive growth by HGF-Met is essential. Met and Ron receptor signalling occurs via a two-phosphotyrosine multifunctional docking site located in their C-terminal regions.

HGF is a pleiotropic cytokine known to be involved in tissue regeneration and repair (Van de Woude et al, 1997). HGF exerts mitogenic and motogenic effects in different cell types. One of the mechanisms by which HGF exerts its antiproliferative effect is induction of apoptosis. HGF activation of Ras and phosphatidylinositol-3-kinase through the multifunctional docking site is required for receptor-mediated invasive growth. In a number of malignant tumours *met* and *ron* are mutated, amplified or overexpressed. Oncogenically activated *met* and *ron* confer transforming,

invasive and metastatic properties to normal cells. Point mutations of the multifunctional docking site dissociate the transforming potential from the invasive-metastatic phenotype showing that distinct signalling pathways are involved. An increasing number of reports have implicated Met-HGF signalling in a variety of human cancers (Yanagawa et al, 1998).

Nerve growth factor (NGF) was characterized over 4 decades ago, and like the other neurotrophins subsequently discovered, it is best known for its trophic role, including the prevention of programmed cell death in specific populations of neurons in the peripheral nervous system. This property can be accounted for by the activation of a tyrosine kinase receptor. NGF also regulates neuronal function, as illustrated by its role in pain and inflammation, and in synaptic plasticity. Numerous studies published in the last 10-15 years have shown that NGF, a polypeptide originally discovered in connection with its neurotrophic activity, also acts on cells of the immune system. Finally, NGF recently was shown (Frade and Barde, 1998) to activate the neurotrophin receptor p75 (p75NTR), a receptor with no intrinsic catalytic activity and with similarities to members of the tumor necrosis factor receptor family. During normal development, the activation of p75NTR by NGF actually kills cells in the central nervous system (Frade and Barde, 1998). One remarkable property of NGF is then that it controls cell numbers in opposite ways in the developing nervous system, a result of its unique ability to activate two different receptor types. NGF has been found in various immune organs including the spleen, lymph nodes and thymus, and cells such as mast cells, eosinophils, and B and T cells (Aloe et al, 1997).

The circulating levels of NGF increase in inflammatory responses, in various autoimmune diseases, in parasitic infections, and in allergic diseases. Stress-related events both in animal models and in man also result in an increase of NGF, suggesting that this molecule is involved in neuroendocrine functions (Connor et al, 1998). The rapid release of NGF is part of an alerting signal in response to either psychologically stressful or anxiogenic conditions in response to homeostatic alteration. Thus, the inflammation and stress-induced increase in NGF might alone or in association with other biologic mediators induce the activation of immune cells during immunologic insults. Recent evidence suggests that neurotrophic factors that promote the survival or differentiation of developing neurons may also protect mature

neurons from neuronal atrophy in the degenerating human brain. Furthermore, it has been proposed that the pathogenesis of human neurodegenerative disorders may be due to an alteration in neurotrophic factor and/or trk receptor levels. The use of neurotrophic factors as therapeutic agents is a novel approach aimed at restoring and maintaining neuronal function in the central nervous system (CNS).

Porphyrins have been of interest of chemists and medical scientists for over a century. It has been known for many years that porphyrins interact with neoplastic tumors and the fact that porphyrins demonstrate high affinity to tumorigenic cells *in vitro* and solid tumors *in vivo*, is well established (Dougherty et al, 1998; Jori et al, 1986).

Porphyrin derivatives have been disclosed for the treatment of tumors, cancers and malignant tissues in combination with electromagnetic radiation or radioactive emissions. Since they absorb light strongly in the 690-880 nm region, many porphyrins were suggested for use as photosensitizers in photodynamic therapy (PDT). See, for example, US Patent Nos. 5,268,371 and 5,272,142, European Patent Nos. 213272 and 584552 and Jori et al, (1986).

Some porphyrin derivatives have been disclosed for use in combination with electromagnetic radiation or radioactive emissions for inhibiting angiogenesis. See, for example, the PCT publications WO 95/24930, WO 94/12239 and WO 93/02192 and US Patents Nos. 5,576,013 and 5,284,647. Some publications suggested the use of porphyrin derivatives as anti-tumor agents in the absence of electromagnetic radiation or radioactive emission based on their ability to cleave DNA (US 4,658,023 and US 5,236,914). The porphyrins disclosed in US Patent No. 5,236,914 always include a central Fe or Mn metal atom and may be substituted by 1 to 3 positively charged N-alkyl-pyridylium groups.

Corroles are slightly contracted porphyrins. The corroles are much less known than porphyrins and their synthesis is very complex. The first corrole was reported in 1965. A simple procedure for corrole synthesis is the subject of Israel Patent Application No. 126426. Neither this patent application nor any other publication disclose or suggest any pharmaceutical application of corroles.

None of the foregoing references teach or suggest that the porphyrin and corrole compounds of the compositions of the present invention inhibit growth factor receptor tyrosine kinase (RTK) activity.

## DESCRIPTION OF THE INVENTION

It has now been found, according to the present invention, that certain porphyrin and corrole compounds can inhibit growth factor receptor tyrosine kinase (RTK) activity.

The present invention thus relates, in one aspect, to a pharmaceutical composition for inhibiting growth factor receptor tyrosine kinase (RTK) activity comprising a tetrapyrrolic macrocycle selected from a 5,10,15,20-tetraaryl-porphyrin and a 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, and a pharmaceutically acceptable carrier.

The growth factor RTK whose activity is inhibited by the compositions of the invention may be fibroblast growth factor (FGF) RTK, epidermal growth factor (EGF) RTK, heparin-binding EGF-like growth factor (HB-EGF) RTK, platelet-derived growth factor (PDGF) RTK, vascular endothelial growth factor (VEGF) RTK, nerve growth factor (VGF) RTK, hepatocyte growth factor (HGF) RTK, insulin RTK and insulin-like growth factor (IGF) RTK.

All fibroblast growth factor receptors are encompassed by the invention but particularly FGFR-1 and FGFR-3 are envisaged, which ligands are, among others, bFGF and FGF9, respectively.

In one aspect, the pharmaceutical compositions of the invention are used for inhibition of cell proliferation mediated by growth factor RTK activity. In one embodiment of this aspect, the compositions are used for inhibition of angiogenesis or neovascularization by particularly inhibiting the binding of VEGF to a VEGF receptor. The treatment of a condition characterized by excess of undesired angiogenesis with such a composition is not accompanied by any added electromagnetic radiation having a frequency absorbed by the porphyrin or corrole derivative or any radioactive emissions from said derivatives. Preferred compounds according to the invention for treatment of angiogenesis are the porphyrin herein designated P1 and the corrole herein designated P21.

In another embodiment of this aspect, the compositions are used for inhibition of vascular smooth muscle cell proliferation in disorders including atherosclerosis, hyperthrophic heart failure and postsurgical restenosis.

Restenosis after successful percutaneous transluminal coronary angioplasty (PTCA) remains a major problem despite great improvement in the technique, use of certain drugs and stents implantation. Heparin-binding growth factors (HBGF), mainly the FGFs and HB-EGF, play a crucial role in the pathogenesis of restenosis by enhancing medial smooth muscle cells (SMC) migration and proliferation and subsequently neo-intima formation. The FGF antagonists comprised in the compositions of the present invention interfere with the interaction between HBGF and their receptors and exert a marked inhibitory effect on SMC proliferation as shown by direct cell proliferation assays and reduced thymidine incorporation, as well as by direct inhibition of high affinity basic FGF *in vitro* and on cells. The inhibitors block ligand-receptor interaction by competitively inhibiting the essential association between both ligand and receptor with heparan sulfates and in a dose-dependent manner. According to the invention, porphyrin compounds P1 and P20 were found particularly active in the prevention of restenosis after PTCA by specifically inhibiting SMC proliferation and luminal narrowing by the neo-intima.

In another embodiment of this aspect, the compositions of the invention are used for inhibition of cell proliferation and migration in the treatment of primary tumors and metastasis. The inhibition of tumor growth and metastasis, processes in which bFGF appears to play a pivotal role, was tested both *in vitro* and *in vivo* with the porphyrins and corroles. A clear inhibition of primary tumor formation in nude mice model and of primary tumor growth and metastasis in C57 black mice injected with LLC could be observed, particularly with the compounds herein designated P1, P5, P7, P20 and P21.

In another embodiments of this aspect, the compositions of the invention are used for treatment of nonmalignant tumors such as benign prostate hyperthrophy, diabetic retinopathy, psoriasis, rheumatoid arthritis, and other disorders including retrolental fibroplasia, macular degeneration, hemangioma, arteriovenous malformation, hypertrophic scars, acne, scleroderma and autoimmune diseases.

In another aspect, the pharmaceutical compositions of the invention are used for treatment of bone and cartilage related disorders including inherited skeletal disorders such as achondroplasia, dwarfism, craniosynostosis. According to the invention, the compounds, and particularly the porphyrin herein designated P16, were

found to inhibit the binding of FGF9 to FGFR-3, indicating that they can be useful for treating FGFR-3 related growth disorders such as achondroplasia

The pharmaceutical composition of the invention comprises particularly a 5,10,15,20-tetraaryl-porphyrin of the formula:

wherein  $Ar_1$ ,  $Ar_2$ ,  $Ar_3$ , and  $Ar_4$ , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged,  $n$  is an integer from 2 to 4 and  $X$  is a pharmaceutically acceptable anion, or

a 5,10,15-triaryl-corrole of the formula:

wherein  $Ar_1$ ,  $Ar_2$ , and  $Ar_3$ , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged,  $n$  is an integer from 2 to 3 and  $X$  is a pharmaceutically acceptable anion.

As defined herein, the carboaryl radical, by itself or as part of the mixed carboaryl-heteroaryl radical, is a substituted monocyclic or bicyclic aromatic radical and the heteroaryl radical, by itself or as part of the mixed carboaryl-heteroaryl radical, is a substituted 5-6 membered aromatic ring containing 1-3 heteroatoms selected from O, S and/or N.

The carboaryl radical may be phenyl, biphenyl or naphthyl substituted by one or more radicals including, but not being limited to, halogen, alkyl, alkoxy, alkylamino, aminoalkylamino, and trialkylammonium, wherein the alkyl radical may have from 1 to 8, preferably 1-4, carbon atoms. The halogen may be chloro or, preferably, fluor. The carboaryl radical may be a phenyl radical substituted by fluoro such as, for example, pentafluorophenyl, or by  $\text{tri}(\text{C}_1\text{-C}_8)\text{alkylammonium}$ , for example, 4-trimethylammoniophenyl, or it may have different substituents, for example, amino( $\text{C}_1\text{-C}_8$ )alkylamino-tetrafluorophenyl, e.g. 4-aminopropylamino-2,3,5,6-tetrafluorophenyl, or  $\text{tri}(\text{C}_1\text{-C}_8)\text{alkylammonium-tetrafluorophenyl}$ , for example, 4-trimethylammoniophenyl-2,3,5,6-tetrafluorophenyl.

The heteroaryl radical may be a 5-6 membered aromatic ring containing 1-3 heteroatoms selected from O, S and/or N including, but not being limited to, furyl, thienyl, pyrrolyl, imidazolyl, thiazolyl, pyridyl, pyrimidyl and triazinyl, substituted by one or more radicals including, but not being limited to, halogen, alkyl, alkoxy, alkylamino, aminoalkylamino, and trialkylammonium. Examples of such heteroaryl radicals are  $\text{N}-(\text{C}_1\text{-C}_8)\text{alkyl-pyridylium}$ , preferably 2-, 3- or 4-(N-methyl) pyridylium.

An example of a mixed carboaryl-heteroaryl radical according to the invention is  $\text{N}-(\text{C}_1\text{-C}_8)\text{alkyl-pyridylium-tetrafluorophenyl}$ , for example, 4-(N-methyl-2-pyridylium)-2,3,5,6-tetrafluoro-phenyl and the corresponding 3- and 4-(N-methyl) pyridylium compounds.

The anion  $\text{X}^-$  according to the invention is a halide, preferably  $\text{I}^-$ , or a pseudo halide anion, or the anion of a carboxylic or sulfonic acid, for example from alkyl sulfonate, trifluoromethyl sulfonate or tosyl (p-toluene sulfonic acid).

Some of the porphyrins used in the present invention are known and either are commercially available or can be prepared by known procedures. P1 – P5, for example, are commercially available, and P15, for example, can be prepared according to La et al, 1997.

In another aspect, the invention relates to novel 5,10,15,20-tetraaryl-porphyrins of the formula:

wherein  $Ar_1$ ,  $Ar_2$ ,  $Ar_3$ , and  $Ar_4$ , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged,  $n$  is an integer from 2 to 4 and  $X$  is a pharmaceutically acceptable anion, and wherein at least one of the non-positively charged aryl radicals, if present, is pentafluorophenyl or 4-amino( $C_1$ - $C_8$ )alkylamino-2,3,5,6-tetrafluorophenyl, and at least two of the positively charged aryl radicals are  $N$ -( $C_1$ - $C_8$ )alkyl-pyridylium or 4- $N$ -( $C_1$ - $C_8$ )alkyl-pyridylium-2,3,5,6-tetrafluorophenyl, particularly 4-( $N$ -methyl-2-pyridylium)-2,3,5,6-tetrafluorophenyl, 4-( $N$ -methyl-3-pyridylium)-2,3,5,6-tetrafluorophenyl or 4-( $N$ -methyl-4-pyridylium)-2,3,5,6-tetrafluorophenyl

The novel porphyrins of the invention include the compounds herein designated **P16**, **P17**, **P18**, **P19** and **P20**, which formulas appear in **Appendix A**.

The novel porphyrins according to the invention corresponding to the general formula II:

in which Ar represents:

wherein the nitrogen atom (and the positive charge) is located at either the 2-, or 3-, or 4- position, and R represents C<sub>1</sub>-C<sub>8</sub> linear or branched alkyl, and X<sup>-</sup> represents a halide or pseudohalide anion, or the anion of a carboxylic or sulfonic acid, are prepared by a three-step method comprising:

a) condensation of pyrrole with a mixture of pentafluorobenzaldehyde and either 2-, or 3-, or 4-pyridinecarboxaldehyde in an acidic medium, such as to obtain a mixture of all possible substituted precursors in which the nitrogen atoms are tertiary and free of positive charges;

b) chromatographic separation of the above mentioned precursors by liquid chromatography. The relative amounts of each precursor are controlled in step (a), by adjusting the ratio of the appropriate pyridinecarboxaldehyde and pentafluorobenzaldehyde; and

c) each of the purified precursors obtained in step (b), after optional protection of the inner nitrogens of the porphyrin ring by magnesium or zinc, is subjected to an alkylation reaction by means of either an alkyl halide, or an alkyl tosylate, or an alkyl sulphonate.

The corrole compounds used in the present invention are prepared by the method described in Israel Patent Application No. 126426 which comprises solvent-free condensation of pyrrole with the appropriate aldehyde, followed by dehydrogenation and alkylation to obtain the desired salt.

In still another aspect, the present invention provides a pharmaceutical composition comprising a pharmaceutically acceptable carrier and a tetrapyrrolic macrocycle selected from a novel 5,10,15,20-tetraaryl-porphyrin as defined above and a 5,10,15-triaryl-corrole, wherein said aryl radical of the corrole compound is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged. The novel porphyrins are preferably the

compounds herein designated P16, P17, P18, P19 and P20, and the corrole is preferably the compound P21.

In a further aspect, the invention relates to a method for inhibiting growth factor receptor tyrosine kinase (RTK) activity comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit growth factor receptor activity.

The invention further relates to a method for inhibiting angiogenesis comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit angiogenesis.

The invention still further relates to a method for prevention of restenosis after percutaneous transluminal coronary angioplasty comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit smooth muscle cell proliferation. For this purpose, the selected porphyrin or corrole may be used also in a slow release mode by direct administration into the affected site in the vessel wall or as a chemical conjugate with locally implanted stents.

The invention also relates to a method for inhibiting primary tumor growth and metastasis comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit primary tumor growth and metastasis.

The compositions of the present invention can be administered by any suitable mode of administration, e.g. orally or, preferably by injection, e.g. intravenously or subcutaneously, or by conjugation to locally implanted stents. The doses will depend

on the condition of the patient and the disorder being treated and can be between 0.1 to 10 mg/kg/day, preferably from 1 to 5 mg/kg/day.

### BRIEF DESCRIPTION OF THE DRAWINGS

Figs.1A-1C show inhibition of bFGF binding to FGFR-1 by compound P1 (5,10,15,20-tetrakis(N-methyl-4-pyridylum)-21H,23H-porphine tetra p-tosylate), wherein:

Fig. 1A shows the inhibitory effect of P1 on soluble FGFR-1 alkaline phosphatase fusion protein (FRAP) binding to bFGF immobilized on heparin. The binding was carried out as described in Methods, section (ii). The alkaline phosphatase (AP) enzymatic activity measured at 405 nm represents the level of FRAP binding;

Fig. 1B shows the inhibitory effect of P1 on  $^{125}\text{I}$ -bFGF binding to immobilized FRAP. The binding was carried out as described in Methods, section (iii). Results represent the mean value in one of at least two independent experiments; and

Fig. 1C shows the inhibitory effect of P1 on the binding of  $^{125}\text{I}$ -bFGF to CHO cells transfected with FGFR-1. The binding was carried out as described in Methods, section (iv). Non-specific binding was determined in the presence of 100-fold excess of unlabeled bFGF ligand, and did not exceed 20% of the total bound ligand.

Fig. 2 shows the inhibitory effect of P1 on the covalent cross-linking of  $^{125}\text{I}$ -FGF and  $^{125}\text{I}$ -FGF9 to CHO cells transfected with FGFR-1 and FGFR-3, respectively. Binding of  $^{125}\text{I}$ -bFGF to confluent monolayers of FGFR-1 expressing CHO cells or  $^{125}\text{I}$ -FGF9 to FGFR-3 expressing CHO cells, was performed as described in Methods, section (iv), in the presence or absence of P1. After 90 min, disuccinylimidyl suberate [DSS] in PBS was added and the protein complexes were separated by electrophoresis on a 7.5% SDS-polyacrylamide gel, and analyzed by autoradiography.

Fig. 3 illustrates an *in vitro* angiogenic assay using a rat aorta section immobilized in a collagen gel. Sections of rat aorta were immobilized in a collagen gel, and the extent of endothelial cell growth and microvascular tubules sprouting from the vessel tissue embedded in the gel was measured upon the addition of bFGF

to the medium, in the absence (no inhibitor) or presence of 10 and 100  $\mu\text{g/ml}$  of P1. The results are expressed as the percent of microvascular tubule sprouting in comparison to the control experiment of bFGF addition. Basal tubule formation could be detected even when no additional factors were added.

Fig. 4 shows the inhibitory effect of P1 on tumor growth induced by signal peptide bFGF in a nude mice model. NIH 3T3 cells expressing signal peptide bFGF were injected subcutaneously to Balb/C nude mice. Twenty five  $\mu\text{g/g}$  of body mass of free or liposome incorporated P1 were injected intraperitoneally (IP) twice a week. Tumor size was measured after 4 weeks.

Fig. 5 shows inhibition of primary tumor growth in the Lewis lung carcinoma (LLC) murine tumor model by porphyrin P1. Lewis lung carcinoma cells were injected into the foot pads of 10-week old C57 black mice. Twenty five  $\mu\text{g/g}$  of body mass P1 were injected intraperitoneally twice a week and tumor size was measured after 4 weeks.

Fig. 6 shows inhibition of metastasis growth in the LLC murine tumor model by P1. Lewis lung carcinoma cells were injected into the foot pads of C57 black mice and primary tumors were allowed to develop. After their formation, the primary tumors were removed and metastases were allowed to develop for four weeks before mice were sacrificed. Twenty five  $\mu\text{g/g}$  of body mass P1 were injected intraperitoneally twice a week. The mice were sacrificed, dissected and the lungs removed and photographed.

Fig. 7 depicts quantitative analysis of the inhibition of metastasis growth in the LLC murine tumor model by P1. Murine lung metastases were induced as described in Methods, section (vii). The mice were sacrificed and the extent of lung metastasis was measured by weighing the lungs.

Figs. 8A-8B show inhibition of bFGF binding to FGFR-1 wherein: Fig. 8A shows the effect of P7, P15-18 on soluble FGFR-1 alkaline phosphatase fusion protein (FRAP) binding to bFGF immobilized on heparin carried out, as described in Fig. 1A; and Fig. 8B shows the effect of P1, P20 and P21 on  $^{125}\text{I}$ -bFGF binding to immobilized FRAP, carried out as described in Fig. 1B.

Fig. 9 shows quantitative analysis of the inhibition of metastasis growth in the LLC tumor model by various porphyrins. The experiment was conducted as described in Fig. 7.

Figs. 10A-10B show the effect of porphyrins on the binding of VEGF to its receptors, wherein:

Fig. 10A shows the effect of P1 on the binding of  $^{125}\text{I}$ -VEGF to endothelial cells transfected with the VEGF receptor KDR. Binding of  $^{125}\text{I}$ -VEGF to confluent monolayers of endothelial cells expressing KDR was performed as described in Methods, section (x), in the presence of increasing concentrations of P1 and of unlabeled VEGF; and

Fig. 10B shows the effect of porphyrins P1, P7, P15, P16 and P18 on soluble VEGF receptor flt-1-AP fusion protein binding to VEGF immobilized to heparin, carried out as described in Methods, section (ix).

Fig. 11 shows the inhibitory effect of porphyrins on binding of  $^{125}\text{I}$ -FGF9 to immobilized FGFR-3.  $^{125}\text{I}$ -FGF9 (2 ng/ml) was incubated (90 min,  $4^{\circ}\text{C}$ ) with immobilized FGFR-3 as described in Methods, section (iii). Incubations were performed in the presence of 100 ng/ml heparin and increasing concentrations of porphyrins. Non-specific binding was determined in the presence of 100-fold excess of unlabeled bFGF and did not exceed 10% of the total binding. Results represent the mean value in one of at least two independent experiments.

Fig. 12 shows the effect of porphyrins on the binding of  $^{125}\text{I}$ -FGF9 to CHO cells transfected with FGFR-3. CHO mutant cells-745 expressing FGFR-3 were incubated for 90 min at  $4^{\circ}\text{C}$  in the presence of increasing concentrations of the porphyrins, with 1  $\mu\text{g}/\text{ml}$  of heparin and  $^{125}\text{I}$ -FGF9 (2 ng/ml). The binding medium was discarded and the cells were washed with ice cold DMEM/BSA. To determine receptor binding of  $^{125}\text{I}$ -FGF9, the cells were incubated in cold PBS (pH 4) containing 1.6M NaCl and 25 mM HEPES, and the cell extract was counted in a  $\gamma$ -counter. Non-specific binding was determined in the presence of 100-fold excess of unlabeled ligand, and did not exceed 20% of the total bound ligand.

Fig. 13 shows the effect of porphyrins P1 and P16 on FGF-9 induced mitogenic activity of FGFR-3 expressing cells. CHO cells genetically engineered to express FGFR-3 were grown in the presence of increasing concentrations of

porphyrins **P1** and **P16** in order to determine the ability of the porphyrins to inhibit FGF-9 induced DNA synthesis.

Fig. 14 is an immunoblot showing total FGFR-3 tyrosine phosphorylation induced by FGF-9. Phosphorylation level of FGFR-3 tyrosine kinase in the presence of **P16** was demonstrated by immunoprecipitation of FGFR-3 with anti-FGFR-3 antibodies and immunoblotting with anti-phosphotyrosine antibodies.

Figs. 15 A-15B show PLC- $\gamma$  and ERK phosphorylation of FGFR-3 expressing cells induced by FGF-9. Phosphorylation level of PLC- $\gamma$  (Fig. 15A) and ERK (Fig. 15B) in the presence of FGF9 and **P16** was examined by immunoblotting with anti-PLC- $\gamma$  or activated ERK antibodies.

Fig. 16 shows the inhibitory effect of **P1** on bFGF-induced mitogenic activity of smooth muscle cells.

## EXAMPLES

### I CHEMICAL SECTION – SYNTHESIS AND CHARACTERIZATION

#### LIST OF COMPOUNDS

In the Examples, the following compounds **P1-P21**, which formulas are presented in **Appendix A** hereinafter just before the References, will be identified by their symbols in bold:

- P1** 5,10,15,20-Tetrakis(N-methyl-4-pyridylum)-21H,23H-porphine tetra-p-tosylate
- P2** 5,10,15,20-Tetrakis(pentafluorophenyl)-21H,23H-porphine.
- P3** 5,10,15,20-Tetrakis(4-methoxyphenyl)-21H,23H-porphine.
- P4** Tetrakis(4-cumyloxyphenoxy)phthalocyanine
- P5** 5,10,15,20-Tetrakis[4-(trimethylammonio)phenyl]-21H,23H-porphine  
tetra-p-tosylate
- P6** 5,10,15,20-Tetrakis(N-methyl-4-pyridylum)-21H,23H-porphine aluminium  
hydroxide tetraiodide
- P7** 5,10,15,20-Tetrakis(N-methyl-2-pyridylum)-21H,23H-porphine tetraiodide
- P8** 5,10,15,20-Tetrakis(N-methyl-4-pyridylum)-21H,23H-porphine tetraiodide
- P9** 5,10,15,20-Tetrakis(N-methyl-2-pyridylum)-21H,23H-porphine tetra-p-tosylate
- P10** 3,8,13,18-Tetrakis(N-methyl-4-pyridylum)- 21H,23H-porphine tetraiodide

- P11 5,10,15,20-Tetrakis(4-carboxylatophenyl) 21H,23H-porphine tetraammonium
- P12 5,10,15,20-Tetrakis(N-methyl-3-pyridylum)-21H,23H-porphine tetra-p-tosylate
- P13 5,10,15,20-Tetrakis(N-methyl-3-pyridylum)-21H,23H-porphine tetraiodide
- P15 5,10,15,20-Tetrakis(2,3,5,6-tetrafluoro-4-trimethylammonio-phenyl)-21H,  
23H-methyl-porphine tetra-trifluoromethylsulfonate
- P16 5-Pentafluorophenyl-10,15,20-tris(N-methyl-4-pyridylum)-21H,23H-porphine  
triiodide
- P17 5,15-Bis(pentafluorophenyl)-10,20-bis(N-methyl-4-pyridylum)-  
21H,23H-porphine diiodide
- P18 5,10-Bis(pentafluorophenyl)-15,20-bis(N-methyl-4-pyridylum)-  
21H,23H-porphine diiodide
- P19 5,10,15-Tris(N-methyl-4-pyridylum)-20-(2,3,5,6-tetrafluoro-4-aminopropyl-  
amino-phenyl)-21H,23H-porphine triiodide
- P20 5,10,15,20-Tetrakis[4-(N-methyl-2-pyridylum) 2,3,5,6-tetrafluoro-phenyl]-  
21H,23H-porphine tetraiodide
- P21 5,10,15-Tris[2,3,5,6-tetrafluorophenyl-4-(N-methyl-2-pyridylum)]-  
21H,23H-corrole triiodide

Compounds P1-P13 and P15 are known. Compounds P1, P5-P10, and P15-P21 inhibit growth factor RTK activity in at least one of the assays tested and their use is encompassed by the present invention. Porphyrins P16-P20 are new and are covered by the present invention. Corrole compound P21 was first disclosed in copending Israel Patent Application No. 126426 filed on 29.09.1998 by one of the coapplicants of the present application but its pharmaceutical use is herein disclosed for the first time.

## **I Example 1. Preparation of Compounds P16, P17, P18**

### **1a) Preparation of the intermediate compounds – Condensation step**

A mixture of 4.3 mL (45 mmol, 3 eq.) of 4-pyridinecarboxaldehyde, 2.06 mL (16.5 mmol, 1 eq.) of pentafluorobenzaldehyde, and 4.15 mL (60 mmol, 4 eq.) pyrrole was dissolved in 300 mL of acetic acid, and the mixture was heated to reflux for 2 h. After cooling to room temperature, the solvent was evaporated to dryness by vacuum and the oily residue was washed by hot water, neutralized by aqueous ammonia (25%), and washed again with hot water. The purple solids obtained by this

procedure were filtered and dried. The dry solid material was treated with three portions of 50 mL of dichloromethane, each followed by filtration. To the combined organic phases, 10 g of silica were added, and the solvent was evaporated to dryness.

#### 1b) Chromatographic separation

Separation and purification of the components obtained in step 1a was achieved by column chromatography, in which the polarity of the eluents was gradually increased from dichloromethane to mixtures of dichloromethane and 2-10% ethanol. The order of elution (the  $R_f$  values are for silica with 2% EtOH in  $\text{CH}_2\text{Cl}_2$ ) and the chemical yields were as follows:

5,10,15,20-tetrakis(2,3,4,5,6-pentafluorophenyl)porphyrin (1a=P2, traces,  $R_f$  = 0.95).

5,10,15-tris(2,3,4,5,6-pentafluorophenyl)-20-(4-pyridyl)porphyrin (1b, 1.1%,  $R_f$  = 0.66).

5,15-bis(2,3,4,5,6-pentafluorophenyl)-10,20-bis(4-pyridyl)porphyrin (1c,  $R_f$  = 0.60)\*.

5,10-bis(2,3,4,5,6-pentafluorophenyl)-15,20-bis(4-pyridyl)porphyrin (1d,  $R_f$  = 0.54)\*.

5-(2,3,4,5,6-pentafluorophenyl)-10,15,20-tris(4-pyridyl)porphyrin (1e, 9.4%,  $R_f$  = 0.45).

5,10,15,20-tetrakis(4-pyridyl)porphyrin (1f, traces,  $R_f$  = 0.18).

\* The combined yield of compounds 1c and 1d was 13.4%. Their separation required an additional column in which the eluent was 2% ethanol in dichloromethane.

Spectroscopic characteristics of the compounds (1a and 1f are known compounds):

1a, UV-vis ( $\text{CH}_2\text{Cl}_2$ ):  $\lambda_{\text{max}}$  (nm) 412, 506, 586;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  8.91 (s, 8H), -2.93 (s, 2H);  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  -136.9 (dd,  $J_1$  = 22.8 Hz,  $J_2$  = 7.0 Hz, 8F), -151.6 (t,  $J$  = 20.7 Hz 4F), -161.7 (dd,  $J_1$  = 22.4 Hz,  $J_2$  = 5.8 Hz, 8F).

1b, UV-vis ( $\text{CH}_2\text{Cl}_2$ ):  $\lambda_{\text{max}}$  (nm) 414, 506, 582;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  9.06 (d,  $J$  = 4.3 Hz, 2H), 8.89 (s, 6H), 8.16 (d,  $J$  = 4.2 Hz, 2H), 8.15 (s, 2H), -2.92 (s, 2H);  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  137.0 (m, 6F), -151.8 (m (2 overlaying t), 3F), -161.8 (m, 6F);  $\text{MS}^+$  ( $e/z$ ) 886.1 ( $\text{MH}^+$ , 100%),  $\text{MS}^-$  ( $e/z$ ) 884.6 ( $\text{M}^-$ , 40%), ( $[\text{M} - \text{H}]^-$ , 60%).

1c, UV-vis ( $\text{CH}_2\text{Cl}_2$ ):  $\lambda_{\text{max}}$  (nm) 412, 508, 584;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  9.06 (d,  $J$  = 4.4 Hz, 4H), 8.89 (s, 4H), 8.85 (s, 4H), 8.15 (d,  $J_1$  = 4.5 Hz, 4H), -2.94 (s, 2H);  $^{19}\text{F}$

NMR (CDCl<sub>3</sub>):  $\delta$  -137.2 (dd,  $J_1 = 23.2$  Hz,  $J_2 = 7.2$  Hz, 4F), -152.0 (t,  $J = 20.9$  Hz, 2F), -161.9 ( $J_1 = 22.8$  Hz,  $J_2 = 7.3$  Hz, 4F); MS<sup>+</sup> ( $m/z$ ) 797.4 (MH<sup>+</sup>, 100%), MS<sup>-</sup> ( $m/z$ ) 794.9 ([M - H]<sup>-</sup>, 100%).

1d, UV-vis (CH<sub>2</sub>Cl<sub>2</sub>):  $\lambda_{\text{max}}$  (nm) 414, 508, 582; <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  9.06 (d,  $J = 5.8$  Hz, 4H), 8.89 (d,  $J = 6.6$  Hz, 4H), 8.84 (m, 4H), 8.15 (dd,  $J_1 = 4.3$  Hz,  $J_2 = 1.5$  Hz, 4H), -2.90 (s, 2H); <sup>19</sup>F NMR (CDCl<sub>3</sub>):  $\delta$  -137.1 (dd,  $J_1 = 23.4$  Hz,  $J_2 = 8.1$  Hz, 4F), -152.0 (t,  $J = 21.1$  Hz, 2F), -161.9 (td,  $J_1 = 22.8$  Hz,  $J_2 = 7.9$  Hz, 4F); MS<sup>+</sup> ( $m/z$ ) 797.4 (MH<sup>+</sup>, 100%), MS<sup>-</sup> ( $m/z$ ) 794.9 ([M - H]<sup>-</sup>, 100%).

1e, UV-vis (CH<sub>2</sub>Cl<sub>2</sub>):  $\lambda_{\text{max}}$  (nm) 416, 510, 586; <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  9.05 (d,  $J = 5.4$  Hz, 6H), 8.90 (d,  $J = 4.8$  Hz, 2H), 8.84 (m (unresolved doublets), 6H), 8.14 (m (unresolved doublets), 6H), -2.92 (s, 2H); <sup>19</sup>F NMR (CDCl<sub>3</sub>):  $\delta$  -137.3 (dd,  $J_1 = 22.8$  Hz,  $J_2 = 7.9$  Hz, 2F), -152.1 (t,  $J = 21.7$  Hz, 1F), -162.0 ( $J_1 = 23.0$  Hz,  $J_2 = 7.7$  Hz, 2F); MS<sup>+</sup> ( $m/z$ ) 708.1 (MH<sup>+</sup>, 100%), MS<sup>-</sup> ( $m/z$ ) 706.1 ([M - H]<sup>-</sup>, 100%).

1f, <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  9.04 (d,  $J = 5.5$  Hz, 8H), 8.85 (s, 8H), 8.14 (d,  $J = 5.5$  Hz, 8H), -2.95 (s, 2H).

### 1c) Alkylation step

70 mg (0.1 mmol) of 5-(2,3,4,5,6-pentafluorophenyl)-10,15,20-tris(4-pyridyl)porphyrin (compound 1e) or any of the other derivatives 1b - 1f were stirred at room temperature with 3 mL (48 mmol) CH<sub>3</sub>I in 10 mL DMF for 12 hours, after which the reaction mixture was evaporated to dryness by high vacuum at room temperature. The resulting crystals were recrystallized from mixtures of MeOH and EtOAc, thus obtaining:

2b 5,10,15-tris(2,3,4,5,6-pentafluorophenyl)-20-(N-methyl-4-pyridylium)porphyrin iodide: UV-vis (H<sub>2</sub>O):  $\lambda_{\text{max}}$  (nm) 418, 516, 582.

### 2c (compound P17)

5,15-bis(2,3,4,5,6-pentafluorophenyl)-10,20-bis(N-methyl-4-pyridylium)porphyrin diiodide: UV-vis (H<sub>2</sub>O):  $\lambda_{\text{max}}$  (nm) 418, 514, 580.

### 2d (compound P18)

5,10-bis(2,3,4,5,6-pentafluorophenyl)-15,20-bis(N-methyl-4-pyridylium)porphyrin diiodide: UV-vis (H<sub>2</sub>O):  $\lambda_{\text{max}}$  (nm) 416, 514, 582.

2e (compound P16)

5-(2,3,4,5,6-pentafluorophenyl)-10,15,20-tris(N-methyl-4-pyridylium)porphyrin triiodide: UV-vis (H<sub>2</sub>O):  $\lambda_{\text{max}}$  (nm) 420, 516, 584; <sup>1</sup>H NMR (DMSO-*d*<sub>6</sub>):  $\delta$  9.48 (d, *J* = 6.5 Hz, 6H), 9.44 (d, *J* = 5.4 Hz, 2H), 9.17 (m, 6H), 9.02 (d, *J* = 6.5 Hz, 4H), 8.99 (d, *J* = 6.5 Hz, 2H), 4.71 (s, 9 H), -3.13 (s, 2H); <sup>19</sup>F NMR (DMSO-*d*<sub>6</sub>):  $\delta$  -139.3 (dd, *J*<sub>1</sub> = 24.5 Hz, *J*<sub>2</sub> = 5.8 Hz, 2H), -153.4 (t, *J* = 22.2 Hz, 1H), -162.2 (*J*<sub>1</sub> = 23.0 Hz, *J*<sub>2</sub> = 5.1 Hz, 2H).

## I Example 2. Preparation of Compound 20

### 2a. Preparation of the intermediate

5, 10, 15, 20-Tetrakis[(4-(2-pyridyl)-2, 3, 5, 6-tetrafluoro-phenyl)]porphyrin

1 mL of an 1.6 M *n*-BuLi solution (1.6 mmol) was added to a stirred solution of 0.14 mL (1.5 mol) 2-bromopyridine in 8 mL of dry THF under an argon atmosphere at -78°C, at such a rate that the temperature of the reaction mixture did not exceed -70°C. After the addition was complete, the reaction mixture was stirred for 1 h at -78°C, resulting in a clear yellow solution. Next, a solution of 0.1 g (0.1 mmol) 5,10,15,20-tetrakis(2,3,4,5,6-pentafluorophenyl)porphyrin in 5 mL of dry THF was added dropwise. The mixture was stirred for 3 h at -78°C, and then hydrolyzed with saturated aqueous bicarbonate solution. The layers were separated, the aqueous layer washed with ether, and the combined ether extracts were dried and evaporated to a solid residue.

The product was purified by column chromatography on silica gel (2:1 EtOAc:Hexane) and recrystallized from EtOAc:EtOH to give 26-30 mg (20-25% yield) of the pure product as violet solids.

$^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  9.06 (s, 8H), 8.97 (d,  $J = 3.9$  Hz, 4H), 8.03 (t,  $J = 7.7$  Hz, 4H), 7.89 (d,  $J = 7.5$  Hz, 4H), 7.54 (t,  $J = 6$  Hz, 4H), -2.82 (s, 2H).  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ ):  $\delta$ -137.57 (q,  $J = 24.8$  Hz, 8F), 144.11 (q,  $J = 24.6$  Hz, 8F).  $\text{MS}^+$  ( $m/z$ ) 1211.4 ( $\text{MH}^+$ , 100%),  $\text{MS}^-$  ( $m/z$ ) 1208.3 ( $[\text{M}-\text{H}]^-$ , 100%).

The reaction mixture gave more products (~50 mg) that eluted from the column after the desired product, with EtOAc as eluent. The main product from that mixture gave the following spectrum, indicative of more than one pyridyl ring per perfluoro ring.:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  9.19 (d), 9.06 (s), 8.97(d), 8.52(d), 8.43(d), 8.0-7.0 (m), -2.79 (s).  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ ):  $\delta$ -116.0 (d, 1F), -131.5 (d, 1F), -137.6(m, 8F), -144.2 (m, 8F), -145.0 (q, 1F).

2b. Preparation of Compound P20:5,10,15,20-tetra-[4-(N-methyl-2-pyridylum iodide)-2,5,6-tetrafluorophenyl]porphyrin

A mixture of 40 mg (33  $\mu\text{mol}$ ) of 5,10,15,20-tetra[4-(2-pyridyl)-2,3,5,6-tetrafluorophenyl]porphyrin of step 2a and 2.5 ml (40 mmol) of  $\text{CH}_3\text{I}$  in 6 mL of freshly distilled DMF was heated to  $70^\circ\text{C}$  for 5h. After evaporation of the solvent the product recrystallized from MeOH:Ether to give 55 mg (95% yield) of the title compound as violet solids.

UV - vis ( $\text{H}_2\text{O}$ ):  $\lambda_{\text{max}}$  nm ( $\times 10^3$ ) 410 (238), 508 (17.6), 574.  $^1\text{H}$  NMR ( $\text{DMSO}-d_6$ ):  $\delta$  9.70 (s, 4H), 9.59 (s, 4H), 9.52 (d,  $J = 5.8$  Hz, 4H), 9.04 (t,  $J = 7.4$  Hz,

4H), 8.79 (d,  $J = 7.6$  Hz, 4H), 8.54 (t,  $J = 6.8$  Hz, 4H), 4.72 (s, 12H), -3.05 (s, 2H).  $^{19}\text{F}$  NMR ( $\text{DMSO}-d_6$ ):  $\delta$ -137.23 (m, 8F), 137.68 (m, 8F).

**I Example 3. Preparation of compound 19:5-(2,3,5,6-tetrafluoro-4-N-propylamineaniline)-10,15,20-tris(N-methyl-4-pyridylium iodide)porphyrin.**

A mixture of 66 mg (58  $\mu\text{mol}$ ) 5-(2,3,4,5,6-pentafluorophenyl)-10,15,20-tris(N-methyl-4-pyridylium iodide)porphyrin and 0.1 mL (1.2 mmol) of 1,3-diaminopropane was dissolved in 9 mL of freshly distilled DMF and stirred overnight at room temperature. After evaporation of the solvent the product recrystallized from MeOH:Ether to give 60 mg (87% yield) of the title compound.

UV - vis ( $\text{H}_2\text{O}$ ):  $\lambda_{\text{max}}$  nm (  $\times 10^3$ ) 422 (176), 518 (13), 582.  $^1\text{H}$  NMR ( $\text{DMSO}-d_6$ ):  $\delta$  9.46 (d,  $J = 5.6$  Hz, 6H), 9.14 (m, 8H), 8.99 (dd,  $J_1 = 12.7$  Hz,  $J_2 = 5.8$  Hz, 6H), 4.71 (s, 9H), 3.65 (d, 2H), 2.93 (t, 2H), 1.98 (t, 2H), -3.10 (s, 2H).  $^1\text{H}$  NMR ( $\text{D}_2\text{O}$ ):  $\delta$  9.10 (d,  $J = 5.4$  Hz, 6H), 8.73 (bs, 6H), 3.59 (t,  $J = 6.9$  Hz, 2H), 3.11 (t,  $J = 7.5$  Hz, 2H), 2.05 (t,  $J = 7.4$  Hz, 2H).  $^{19}\text{F}$  NMR ( $\text{DMSO}-d_6$ ):  $\delta$ -142.9 (d,  $J = 19.4$  Hz, 2F), 160.5 (d,  $J = 20.4$  Hz, 2F).

**I Example 4: Synthesis of tetrakis(N-methyl-4-pyridyl iodonyl) aluminium porphyrin (Compound P6)**

**4a. Preparation of tetrakis(4-pyridyl)porphyrin**

Freshly distilled 4-pyridylaldehyde and pyrrole (1:1) were refluxed in propionic acid for 2 hrs. The solvent was removed by distillation from the reactive flask under reduced pressure. The oily black residue was washed with hot water, neutralized with aqueous  $\text{NH}_4\text{OH}$  and then washed with DMF to remove the by-products. The purple

precipitate was purified by means of multiple crystallization and recrystallization. Yield: 12%. The product was characterized by  $^1\text{H}$  NMR, UV and MS.

4b. Preparation of tetrakis(4-pyridyl) aluminium porphyrin

The mixture of the product of step 4a,  $\text{Al}(\text{acac})_3$  and phenol was heated in a pressure flask up to  $230^\circ\text{C}$  for 2.5 hrs. The reactive mixture was allowed to cool to room temperature and washed with 2N NaOH and distilled water until pH neutral. Yield 78%.

4c. Preparation of aluminium tetrakis(N-methyl-4-pyridyl iodonyl) porphyrin

1 mmol solution of the product of step 4b in DMF was stirred with excess of methyl iodide at room temperature for 3 hours. The solvent was evaporated and the residue was then recrystallized twice from methanol-ether. Yield 90%.

I Example 5. Synthesis of tetrakis(N-methyl-2-pyridyl iodonyl) porphyrin (Compound P7)

5a. Preparation of tetrakis(2-pyridyl)porphyrin

The procedure is the same as described in Example 4a for the 4-pyridyl compound but the purification and isolation procedures are different. Unlike the 4-analogue, this porphyrin dissolves in DMF, so the isolation and purification have been done through the use of column chromatography on Floricil for initial isolation of the target product from black precipitate and then with use of Silica Gel column for purification of the compound. The further crystallization and multiple recrystallization led to the pure target product.

5b. Preparation of zinc tetrakis(2-pyridyl)porphyrin

To the refluxing mixture of the product of step 5a in DMF, acetate salt of zinc was added and the mixture was stirred for an additional 15 min. Then the flask was cooled and the purple precipitate was washed with methanol and ether. Yield 90%. This Zn-porphyrin was prepared in order to protect the core N-H atoms from possible methylation.

5c. Methylation: Methylation of the product of step 5b was performed as described for the 4-analogue in Example 4c with methyl iodide. Methylation of the Zn-porphyrin

was done as with free-base porphyrin. The NMR shows that core N-H doesn't undergo any methylation in the free base compound.

5d. Deprotection from Zn

Deprotection from Zn was done by extraction with 1% HCL. The product obtained after deprotection contains 9% of unrecognized compound. No purification was done because the target product was already obtained by direct methylation of the free-base porphyrin.

The non-charged intermediate of step 5a and the end product P7 were characterized as follows: 5,10,15,20-tetrakis(2-pyridyl)porphyrin: UV-vis ( $\text{CH}_2\text{Cl}_2$ ):  $\lambda_{\text{max}}$  (nm) 416, 512, 588;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  9.13 (m, 4H), 8.85 (s, 8H), 8.18 (m, 4H), 8.11 (m, 4H), 7.70 (m, 4H), -2.84 (s, 2H). P7 5,10,15,20-tetrakis(N-methyl-2-pyridylium)porphyrin tetraiodide: UV-vis ( $\text{H}_2\text{O}$ ):  $\lambda_{\text{max}}$  (nm) 414 ( $\log \epsilon = 5.03$ ), 510, 580.

I Example 6. Synthesis of tetrakis(N-methyl-4-pyridyl iodoni) porphyrin (Compound P8)

The title compound was prepared by methylation with excess of methyl iodide from the free base parent porphyrin and purified by crystallization.

I Example 7. Synthesis of tetrakis(N-methyl-4-pyridyl tosyl) porphyrin (Compound P1)

The title compound was prepared by methylation with excess of methyl p-toluene sulfonate from the free base parent porphyrin by reflux in DMF and purified by crystallization.

I Example 8. Synthesis of tetrakis(N-methyl-2-pyridyl tosyl) porphyrin (Compound P9)

The title compound was prepared by methylation with excess of methyl p-toluene sulfonate from the free base parent porphyrin by reflux in acetone and purified by crystallization.

I Example 9. Synthesis of tetrakis(4-carboxyl) porphyrin ammonium salt (Compound P11)

A mixture of freshly distilled pyrrole and p-carboxyl-benzaldehyde were refluxed in propionic acid for 3 hrs. The precipitated purple crystals were obtained after cooling the mixture, and then it was filtered. The obtained product was of 95% purity. In order to obtain a more pure product the porphyrin was treated by  $\text{NaHCO}_3$  and extracted with ethyl acetate and methylene chloride. The organic impurities were transferred into the organic layer whereas the target product as the Na salt was in aq. layer. The further neutralization with HCl to  $\text{pH} < 6$  led to the formation of crystal acidic porphyrin which was filtered and dried. The green crystals then were treated by 2M ammonia in methanolic solution until the green color changed to the purple one. The title product was crystallized with water-methanol-methylene chloride. Yield 23%.

#### I Example 10. Synthesis of Compounds P12 and P13

Compounds P12 and P13 are known and were prepared by alkylation with methyl iodide (P13) or methyl toluene sulfonate (P12) of the known non-charged intermediate: 5,10,15,20-tetrakis(3-pyridyl)porphyrin [Chemical Abstract Registry No: 40882-83-5]:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  9.45 (s, 4H), 9.06 (d,  $J=5.5$  Hz, 4H), 8.85 (s, 8H), 8.52 (d,  $J=7.8$  Hz, 4H), 7.77 (dd,  $J_1=7.8$  Hz,  $J_2=5$  Hz, 4H), -2.86 (s, 2H). P13 5,10,15,20-tetrakis(N-methyl-3-pyridylum) porphyrin tetraiodide: UV-vis ( $\text{H}_2\text{O}$ ):  $\lambda_{\text{max}}$  (nm) 416, 514, 582.

#### I Example 11. Preparation of corrole P21

##### 11a. Preparation of intermediate 5,10,15-tris(4-(2-pyridyl)-tetrafluorophenyl) corrole.

0.42 mL of an 1.6 M n-BuLi solution (0.7 mmol) was added to a stirred solution of 0.054 mL (0.56 mmol) 2-bromopyridine in 6 mL of dry THF under an argon atmosphere at  $-78^\circ\text{C}$ , at such a rate that the temperature of the mixture did not exceed  $-70^\circ\text{C}$ . After the addition was complete, the reaction mixture was stirred for 1h at  $-78^\circ\text{C}$ , to give a clear yellow solution. Next, a solution of 0.03 g (0.038 mmol) 5,10,15-tri(2,3,4,5,6-pentafluorophenyl)corrole in 6 mL of dry THF was added dropwise. The mixture was stirred for 1h at  $-78^\circ\text{C}$  and then hydrolyzed with saturated aqueous bicarbonate solution. The layers were separated, the aqueous layer washed with ether, and the combined ether extracts were dried and evaporated to a solid residue.

The product was purified by column chromatography on silica gel (1:1 EtOAc:Hexane) and recrystallized from CH<sub>2</sub>Cl<sub>2</sub>: hexane to give 13 mg (35% yield) of the pure product as violet crystals.

UV – vis (CH<sub>2</sub>Cl<sub>2</sub>):  $\lambda_{\max}$  nm 414 (111.6), 564 (18.4), 606. <sup>1</sup>H NMR (CDCl<sub>3</sub>): 9.12 (d, *J*=3.9 Hz, 2H), 8.93 (m, 5H), 8.73 (d, *J*=4.88 Hz, 2H), 8.66 (d, *J*=3.91 Hz, 2H), 8.00 (dt, *J*<sup>1</sup>=7.81 Hz, *J*<sup>2</sup>=1.95 Hz, 3H), 7.84 (bd, *J*=7.81 Hz, 3H), 7.51 (dt, *J*<sup>1</sup>=6.84 Hz, *J*<sup>2</sup>=1.95 Hz, 3H), -2.02 (bs, 3H). <sup>19</sup>F NMR (CDCl<sub>3</sub>): -138.19 (q, *J*=23.79 Hz, 2F), -138.81 (q, *J*=23.79 Hz, 4F), -144.11 (q, *J*=23.79 Hz, 4F), -144.57 (q, *J*=23.79 Hz, 2F). MS<sup>+</sup> (*m/z*) 972.9 (MH<sup>+</sup>, 100%), MS<sup>-</sup> (*m/z*) 972.7 ([M-H]<sup>-</sup>, 100%).

11b. Preparation of 5,10,15-tris[4-(N-methyl-2-pyridylium iodide)-2,3,5,6-tetrafluorophenyl]corrole (Compound P21)

A mixture of 11 mg (11  $\mu$ mol) of 5,10,15-tri(4-(2-pyridyl)-2,3,5,6-tetrafluorophenyl)corrole prepared in step 11a and 0.8 mL (13 mmol) of CH<sub>3</sub>I in 2 mL of freshly distilled DMF was heated to 70°C for 3h. After evaporation of the solvent the product was recrystallized from MeOH:Ether to give 15.5 mg (98% yield) of the title compound as green solids.

UV – vis (MeOH):  $\lambda_{\max}$  nm (ex10<sup>3</sup>) 430 (76.2), 576 (10.9), 622 (17.8). <sup>1</sup>H NMR (DMSO-*d*<sub>6</sub>): 9.49 (d, *J*=5.98 Hz, 3H), 9.16 (bm, 8H), 9.00 (t, *J*=8.54 Hz, 3H), 8.75 (t, *J*=7.68 Hz, 3H), 8.51 (t, *J*=7.68 Hz, 3H), 4.68 (s, 3H), 4.65 (s, 6H). <sup>19</sup>F NMR (DMSO-*d*<sub>6</sub>): d-137.26 (bm, 4F), -138.04 (bm, 6F), -138.60 (bm, 2F).

## II BIOLOGICAL SECTION

### MATERIALS

Human recombinant bFGF was from American Cyanamid (Pearl River, NY); heparin-coated plates were from Carmeda (Sweden); FRAP was prepared as described (Ornitz et al, 1991); NIH 3T3 cells expressing signal peptide bFGF were generated as described (Yayon and Klagsbrun, 1990); anti-FGFR3 antibody and anti-phosphotyrosine antibody PY-20 were purchased from Santa Cruz Biotechnology (Santa Cruz, CA); anti-ERK 1,2 antibody was purchased from Sigma; DMEM was from Bet Haemek Biological Industries (Israel); compounds P1, P2, P3, P4, P5 were purchased from Aldrich (catalog Nos 32,349-7, 25,292-1, 25,288-3, 41,206-6, 30,678-9, respectively); human recombinant VEGF was provided by H. Wich,

Braunschwig (Germany); anti-AP antibodies were prepared as previously described (Ornitz et al, 1991).

## METHODS

(i) **Animals and Treatment.** Male Balb/C nude and C57/black mice were maintained on lab chow and tap water and were housed with a 12-h day-night cycle.

(ii) **Binding of soluble FGFR-1 alkaline phosphatase fusion protein (FRAP) to immobilized bFGF.** A screening system composed of a heparin matrix, bFGF and FGFR-1 tagged by alkaline phosphatase (FRAP), was designed. Briefly, the screen is conducted using 96-well plates to which heparin has been covalently attached. bFGF is then bound to the plates through heparin-bFGF interactions followed by the addition of FRAP and compounds to be screened for modulation of heparin-FGF, receptor-heparin and receptor-FGF interactions. At the end-point of the assay, the amount of FRAP present on the plates as a heparin-FGF-FRAP ternary complex is measured enzymatically, using the alkaline phosphatase (AP) catalyzed formation of a chromogenic product. Thus, a lowered or elevated AP value, relative to a control, indicates modulation of binding at one or more of the three levels of interaction that describe the FGF-FGFR-heparin ternary complex. bFGF (100 ng/ml) was incubated on 96-well plates to which heparin has been covalently attached. Subsequently, 200  $\mu$ l of FRAP condition medium and porphyrin/corrole compound were added and incubated together for 2h. After three cycles of washing with HNTG (20 mM Hepes pH 7.5, 150 mM NaCl, 1% Triton X-100 and 10% glycerol), alkaline phosphatase substrate (Sigma) (15mM) was added and catalyzation of the chromogenic product was measured by spectrophotometry at 405 nm.

(iii) **Binding of  $^{125}$ I-bFGF or  $^{125}$ I-FGF9 to soluble FGFR-1 or FGFR-3.** Conditioned medium from cells secreting soluble FRAP or FGFR-3 FR-3-AP, was incubated for 45 min at room temperature with rabbit anti-human placental AP antibodies (generated as described in Ornitz et al, 1991) prebound to agarose-protein A beads (Pierce). The FGFR-1 or FGFR-3-coupled beads were washed three times with 1 ml HNTG and incubated with 2 ng/ml of  $^{125}$ I-FGF, 1  $\mu$ g/ml of heparin and porphyrin/corrole compound

at different concentrations for 1h at room temperature. FGFR-bound  $^{125}\text{I}$ -bFGF levels were determined by counting the samples in a  $\gamma$ -counter.

(iv) **Binding of  $^{125}\text{I}$ -bFGF and  $^{125}\text{I}$ -FGF9 to cells.** Confluent cultures of CHO cells transfected with FGFR-1 (Yayon et al, 1991) or FGFR-3 (Hecht et al, 1995) in 24-well plates (Falcon) were precooled and washed twice with cold DMEM supplemented with 20 mM Hepes (pH 7.5) and 0.1% bovine serum albumin (DMEM/BSA). They were then incubated for 1.5 h at  $4^\circ\text{C}$  with  $^{125}\text{I}$ -bFGF (2 ng/ml) and increasing concentrations of porphyrin/corrole compound. The binding medium was discarded and the cells were washed once with ice-cold DMEM/BSA and twice with cold PBS (pH 7.5) containing 1.6M NaCl. High-affinity receptor-bound bFGF was determined by extraction of the cells with 20 mM Na acetate pH 4.0 containing 2.0 M NaCl. Non-specific binding was determined in the presence of a 100-fold excess of unlabeled bFGF.

(v) **Inhibition by porphyrins of tumor formation induced by signal peptide bFGF expressing cells.** NIH 3T3 cells expressing signal peptide bFGF were injected subcutaneously to Balb/C nude mice as described (Yayon and Klagsbrun, 1990). Porphyrin/corrole compound at 25  $\mu\text{g/g}$  of body mass was injected IP (intraperitoneally) twice a week and after 4 weeks the tumor size was measured.

(vi) **Rat aorta *in vitro*: Angiogenesis assay.** Rings of rat aorta sections are immobilized in a three-dimensional collagen gel, in the presence of serum free growth medium (DMEM) (Nicosia & Ottinetti, 1990). After 14 days the cultures are fixed, and the extent of microvascular endothelial tube outgrowth is measured under a light microscope. Porphyrin/corrole compound and bFGF (2 ng/ml) were added to the growth medium twice a week when indicated.

(vii) **Lewis lung carcinoma tumor assay.** Lewis lung carcinoma (LLC) cells ( $1 \times 10^6$  cells/ mouse) were implanted into the foot pads of 10-week old C57 black mice (O'Reilly et al, 1994). Twenty five  $\mu\text{g/g}$  of body mass porphyrin/corrole compound were injected IP twice a week to the treated group, and tumor size was measured periodically in order to follow primary tumor formation. In order to evaluate inhibition of lung metastasis by

porphyrin/corrole compound, the primary tumors were allowed to develop over a period of six weeks to a volume of approximately 8 mm<sup>3</sup>; after which the tumors were removed and metastases were allowed to develop for four weeks. During this time the treated group received 25 µg/g of body mass porphyrin/corrole compound IP twice a week. Subsequently the mice were sacrificed, dissected and the lungs removed and photographed. The extent of lung metastasis was measured by weighing the lungs.

(viii) **Immunoblots** To the overnight serum-starved cells (2 plates for each treatment), 500 µl of F12<sup>++</sup> medium were added which either contained or not the respective porphyrin/corrole compound in a final concentration of 1 µ/ml for 40 min at 37°C. One of the two plates of each treatment was then stimulated with FGF9 (+) (75 ng/ml) and to the second plate only medium (-) was added for 10 min at 37°C. The cells were washed twice with PBS. 600 µl of SBN lysis buffer containing 1% NP-40 and 1 mM vanadate were added and left on ice for 10 min. The plates were then scraped and left on ice for additional 10 min. The lysate was spun down in Eppendorf centrifuge for 15 min, 15000 rpm at 4°C. The supernatants were kept and Bradford protein determination assay was performed in the samples. 500 µg protein from each sample were taken for immunoprecipitation with 7.5 µl antibody against FGFR-3, 4 hr at 4°C. The immunoprecipitated samples as well as total lysates (40 µg) were separated on 7.5% polyacrylamide SDS-PAGE and then transferred to nitrocellulose paper and immunoblotted with the subsequent antibodies.

(ix) **Binding of soluble VEGF receptor alkaline phosphatase fusion protein to immobilized VEGF.** The flt-1 VEGF receptor was expressed as a fusion protein with AP as previously described (Roeckl et al, 1998) and tested for its binding capacity to immobilized VEGF as described in (ii) above for the FGF receptor.

(x) **Binding of <sup>125</sup>I-VEGF to cells.** Confluent cultures of bovine aortic endothelial cells transfected with the VEGF receptor KDR were tested for binding of radiolabeled <sup>125</sup>I-VEGF as described in (iv) above for the FGFR-1 expressing cells.

## II Example 1. Compound P1 inhibits binding of bFGF to FGFR-1 *in vitro*

In order to identify inhibitors of FGF-FGFR interactions, an assay for testing FGFR-ligand binding was developed. The system is composed of bFGF bound to a heparin matrix to which soluble FGFR-1 ectodomain alkaline phosphatase fusion protein (FRAP) and the screened compounds are added (see Methods, section (ii)). The screening according to the invention identified several compounds for their capacity to inhibit soluble FGF receptor (FRAP) binding to FGF immobilized on heparin, the first and very potent one being 5,10,15,20-tetrakis(N-1methyl-4-pyridylum)-21H,23H -porphine tetra-p-tosylate, herein designated Compound P1.

For evaluation of the capacity of P1 to inhibit bFGF-induced activity, its ability to inhibit bFGF binding to FGFR-1 was first tested in *in vitro* systems. P1 was tested for its capacity to inhibit binding of FRAP to bFGF immobilized on heparin matrix. As shown in Fig. 1A, P1 demonstrated potent inhibition at IC<sub>50</sub> of 90 ng/ml, with a classical inhibition pattern.

In order to further examine the capacity of P1 to inhibit bFGF receptor binding, we measured the binding of radiolabeled <sup>125</sup>I-bFGF to FGFR in two experimental systems. First we utilized a cell-free system, measuring the binding of radiolabeled bFGF to immobilized FRAP using an anti-alkaline phosphatase antibody prebound to agarose-protein A beads (see Methods, section (iii)). As a second experimental model, we used CHO cells deficient in heparan sulfate and genetically engineered to express FGFR-1 (Methods, section (iv)). P1 inhibited binding of <sup>125</sup>I-bFGF to the FGF receptor in both experimental systems. Fig. 1B illustrates that the porphyrin P1 is capable of profoundly inhibiting bFGF-FGFR1 binding in the soluble receptor (FRAP) assay in a dose dependent manner with an IC<sub>50</sub> of 2.5 µg/ml. In the cellular receptor system, P1 was capable of inhibiting bFGF binding with an IC<sub>50</sub> of approximately 10 µg/ml (Fig. 1C). The slightly higher concentrations of P1 needed for inhibition of cellular bFGF binding may result from slightly reduced affinity of the soluble FGFR system to the FGF ligand (Ornitz et al, 1991).

## II Example 2. Inhibition of covalent cross-linking of <sup>125</sup>I-bFGF and <sup>125</sup>I-FGF9 to CHO cells by Compound P1

In order to unequivocally determine the specificity of the binding inhibition, chemical cross-linking of  $^{125}\text{I}$ -bFGF and  $^{125}\text{I}$ -FGF9 to CHO cells transfected with FGFR-1 and FGFR-3, respectively, was carried out as described in Methods, section (iv), in the absence or presence of increasing concentrations of P1. As shown in Fig. 2, P1 can inhibit bFGF receptor binding as demonstrated by the formation of a typical bFGF-receptor complex, in agreement with the direct binding data shown in Fig. 1C. Suramin, a well known tyrosine kinase inhibitor, served as a positive control and demonstrated FGF receptor binding inhibition. These results support the notion that the presence of P1 inhibits the binding of bFGF to the high affinity FGF tyrosine kinase receptors.

## II Example 3. Inhibition of angiogenesis *in vitro* by Compound P1

The effect of P1 was further examined in a biological assay for angiogenesis *in vitro*. Angiogenic vascularization is a process in which bFGF is known to play a pivotal role (Folkman, 1989). To examine the inhibitory effects of the porphyrin on bFGF-promoted angiogenesis, we employed an *in vitro* angiogenic assay using a rat aorta section immobilized in a collagen gel (Methods, section (vi)). The assay measures the extent of endothelial cell growth and microvascular tubules sprouting from the vessel tissue embedded in the gel. Basal tubule formation can be detected even when no additional factors are added. As shown in Fig. 3, the addition of 2 ng/ml bFGF alone dramatically increased the degree of cell growth and vascularization, however the addition of 2 ng/ml bFGF combined with P1 at concentrations of 10  $\mu\text{g/ml}$ , dramatically reduced the extent of endothelial cell growth as compared to the bFGF control, and when 100  $\mu\text{g/ml}$  P1 was added in the presence of 2 ng/ml bFGF, complete inhibition was achieved and no endothelial cell growth was observed.

## II Example 4. Tumor formation induced by signal peptide bFGF expressing cells is inhibited by Compound P1

After establishing the ability of P1 to inhibit FGF biological activity *in vitro*, the capacity of P1 to inhibit bFGF-induced tumor growth and metastasis was evaluated *in vivo*. First, the inhibition of tumor growth induced by signal peptide

bFGF in a nude mice model was measured (Methods, section (v)). Upon addition of a signal peptide residue to bFGF, the protein is capable of transforming NIH 3T3 cells which, when injected to nude mice, grow and form a tumor (Yayon & Klagsbrun, 1990). NIH 3T3 cells expressing signal peptide bFGF were injected subcutaneously to Balb/C nude mice, and P1 either free or liposome incorporated (as described by Jori and Reddi, 1993) (25 µg/g of body mass) were given twice a week by intraperitoneal injection. After 4 weeks, a clear inhibition of tumor formation by the free P1 could be seen (Fig 4). These results indicated that P1's capacity to inhibit bFGF receptor binding was not limited to *in vitro* interactions alone but could be shown in *in vivo* assays as well.

## **II Example 5. Compound P1 inhibits the appearance of primary tumors in the Lewis lung carcinoma (LCC) tumor model**

Inhibition of primary tumor growth was tested using the well-established LLC murine tumor growth and metastasis model (Methods, section (vii)). LLC cells were injected into the foot pads of 10-week old C57 black mice. Mice were injected Compound P1 IP twice a week (25 µg/g of body mass) as described in Methods, section (vii). As shown in Fig. 5, the treated mice showed a marked inhibition in primary tumor growth in comparison to the control group. The inhibition of the foot pad primary carcinoma tumor growth was clearly shown and reproduced in several experiments.

## **II Example 6. Compound P1 inhibits the appearance of lung metastasis in the Lewis lung carcinoma model**

After establishing the capacity of P1 to inhibit primary tumor growth, the capacity of P1 to inhibit lung metastasis formation was measured as described in Methods, section (vii). Another set of mice was injected with LLC cells, and the foot pad primary tumor were allowed to develop to a volume of approximately 8 mm<sup>3</sup>. After their formation, primary tumors were removed and metastases were allowed to develop for four weeks before mice were sacrificed. The extent of lung metastasis at this point was examined. Fig. 6 shows that, as expected, metastasis formation occurred in the non-treated mice, while in the mice that were treated with Compound

P1 (25 µg/g of body mass), the lungs were similar to the control mice, with no metastatic phenotype (Fig. 6). In order to quantitate the results from these experiments, the lungs from all mice were weighed and evaluated for the extent of metastatic growth. As can be seen in Fig. 7, the control lungs from mice who were not injected with tumor cells weighed around 200 mg as do the lungs from mice treated with P1.

## II Example 7. Inhibitory effects of porphyrins and corroles on the binding of bFGF to FGFR-1 *in vitro*

Porphyrin compounds P2-P20 and corrole compound P21 were tested as described in Example 1, according to Methods, sections (ii) and (iii). The results are shown in Table 1 and in Figs. 8A-8B.

As can be seen in Fig. 8A, compounds P15 to P18 were active *in vitro* when tested for inhibition of FRAP binding to immobilized bFGF. The next round of porphyrins were tested for their capacity to inhibit radiolabeled bFGF binding to immobilized receptor. As shown in Fig 8B, P16 and P18 inhibited the binding of bFGF with an activity over 100 fold higher than that of P1, indicating that they might have a high potential as bFGF inhibitors.

## II Example 8. Inhibitory effects of porphyrins and corroles *in vivo* in the LLC tumor model

Compounds P1-P21 were tested for capacity to inhibit the appearance of lung metastasis in the LLC model, as described in Example 6. The results are shown in Table 2 and in Fig. 9. Compounds P16-P18 were not as potent as the lead Compound P1 while P5 and P7 had a similar activity as P1 (Fig. 9). Compounds P20 and P21, shown in Example 7 (Fig. 8B) to inhibit bFGF binding *in vitro*, were also shown here to be highly active *in vivo* in the LLC tumor model (Table 2).

## II Example 9. Compound P1 inhibits the binding of VEGF to VEGF-R

Since both FGF and VEGF share several similar characteristics, such as the requirement of heparin for binding to the receptor (Gitay-Goren et al, 1993) and they both play a crucial role in angiogenesis, the ability of P1, P7, P15, P16, P18 to inhibit VEGF binding to its receptors was evaluated. Figure 10A shows that P1 inhibits

$^{125}$ I-VEGF binding to cells highly expressing KDR and has an inhibitory effect similar to that caused by unlabeled VEGF. P1 inhibits VEGF binding to bovine endothelial cells expressing VEGF receptors, in a manner similar to the KDR-transfected cells (Methods, section x). As can be seen in Fig. 10B, while P1 demonstrated an  $IC_{50}$  around 0.04  $\mu$ M, compounds P15 to P18 were less potent with  $IC_{50}$  around 1  $\mu$ M, when tested *in vitro* for inhibition of the VEGF receptor flt-1-AP binding to immobilized VEGF, as described in Methods, section (ix).

## II Example 10. Porphyrin P16 inhibits the binding of FGF-9 to FGFR-3

To test the porphyrins for their potential ability to be used for the treatment of FGF receptor-related growth disorders, their activity in FGFR-3 related systems was tested.

The capacity of the porphyrins P1, P7, P15, P16, P17 and P18 to inhibit FGF-9 induced activity was evaluated by first testing their capability to inhibit FGF-9 binding to FGF receptors in *in vitro* systems. Thus, the compounds were tested for their capacity to inhibit binding of a soluble FGFR-3 ectodomain alkaline phosphatase fusion protein (FR-3-AP) to FGF-9, utilizing a cell free system, similar to the one described for FGFR-1 in Example 1 above, and measuring the binding of radiolabeled  $^{125}$ I-FGF-9 to soluble FGFR-3. As shown in Fig. 11, the porphyrins are capable of profoundly inhibiting FGF-9 / FGFR-3 binding in the soluble receptor assay in a dose dependent manner with an  $IC_{50}$  of 0.1  $\mu$ g/ml, with P15 and P16 being more potent.

As a second experimental model, CHO cells genetically engineered to express FGFR-3 were used (Hecht et al, 1995). As shown in Fig. 12, also in the cellular receptor system, P16 was more potent, being capable of inhibiting FGF-9 binding with an  $IC_{50}$  of 0.1  $\mu$ g/ml.

## II Example 11. Porphyrins P1 and P16 inhibit mitogenic activity of FGFR-3 expressing cells induced by FGF-9.

CHO cells genetically engineered to express FGFR-3 were used in order to determine the ability of the porphyrins P1 and P16 to inhibit biological activity of FGFR3 as measured by the level of DNA synthesis induced by FGF-9. As can be seen in Fig. 13, both P1 and P16 had a strong inhibitory effect on the cell proliferation

induced by FGF-9, indicating that both porphyrins, more particularly P16, may serve as inhibitors of FGFR-3 unregulated activity.

## **II Example 12. Porphyrin P16 inhibits FGFR-3 tyrosine phosphorylation in cells induced by FGF-9.**

FGFR-3 tyrosine phosphorylation is a distinct parameter of biochemical activation of the receptor leading to signal transduction in the cell nucleus and resulting in biological activity. Measuring the phosphorylation level allows a direct judgment as to the ability of an inhibitor to effect receptor activation.

In order to measure the ability of the porphyrins to inhibit the receptor activation on an enzymatic level as well, FGFR-3 tyrosine phosphorylation was measured in the presence of P16, as described in Methods, section (viii). Immunoprecipitation of FGFR-3 with the anti-FGFR-3 antibodies and immunoblotting with anti-phosphotyrosine antibodies demonstrated that P16 reduced both the basal and, to a much greater extent, the FGF-9 induced phosphorylation of FGFR-3 (Fig. 14), indicating that P16 has a significant, direct and highly specific effect on FGFR-3 activity.

## **II Example 13. Porphyrin P16 inhibits PLC- $\gamma$ and ERK phosphorylation in FGFR-3 expressing cells induced by FGF-9.**

Stimulation of FGFR-3 results in a variety of human skeletal genetic defects. The phosphorylated FGFR-3 transduces its signal down stream by transphosphorylation of adaptor proteins which are part of its signaling cascade (Kanai et al, 1997). At least three different FGFR-3 signaling pathways have been identified: 1) the ERK/MAP kinase mediated pathway; 2) the STAT kinase mediated pathway; and 3) the phospholipase C-gamma (PLC- $\gamma$ ) mediated pathway. Examining the level of phosphorylation of these signaling proteins allows one to establish the potency of an inhibitor capable of down regulating FGFR-3 dependent signaling.

In order to demonstrate the effect of P16 on the enzymatic signal transduction pathway induced by FGFR-3, phosphorylation of PLC- $\gamma$  and ERK, two well established players in FGF signaling, was examined in cells expressing FGFR-3. Immunoblotting with anti-PLC- $\gamma$  antibodies (Fig. 15A) or anti-activated ERK/MAP

kinase antibodies (Fig. 15B), respectively, demonstrated clear reduction in the activation of both signal-mediating proteins by P16. These findings support the notion that the porphyrins can serve for treating FGFR-3 related growth disorders. ERK1 and ERK2 are two isoforms of ERK.

## II Example 14. P1 inhibits smooth muscle cells proliferation induced by bFGF.

In order to determine the ability of P1 to inhibit the biological activity of bFGF on cell proliferation, smooth muscle cells were grown in 24-well plates in the presence of bFGF (10 ng/ml) and in the presence of 2  $\mu$ g/ml or 20  $\mu$ g/ml of P1. Cell number was determined daily by counting cell samples under a microscope. As can be seen in Fig. 16, P1 had a strong inhibitory effect on smooth muscle cell proliferation induced by bFGF. These results suggest that P1 may serve as an inhibitor of smooth muscle cells causing restenosis.

**TABLE 1: Inhibitory activity *in vitro* (IC<sub>50</sub> in  $\mu$ M) of compounds P1-P21 on binding of FGF to FGFR**

## CLAIMS

1. A pharmaceutical composition for inhibiting growth factor receptor tyrosine kinase (RTK) activity comprising a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl- porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, and a pharmaceutically acceptable carrier.
2. The pharmaceutical composition according to claim 1, wherein said growth factor RTK is selected from fibroblast growth factor (FGF) RTK, epidermal growth factor (EGF) RTK, heparin-binding EGF-like growth factor (HB-EGF) RTK, platelet derived growth factor (PDGF) RTK, vascular endothelial growth factor (VEGF) RTK, nerve growth factor (VGF) RTK and hepatocyte growth factor (HGF) RTK, insulin RTK and insulin-like growth factor (IGF) RTK.
3. The pharmaceutical composition according to claim 2 for inhibition of cell proliferation mediated by growth factor RTK activity.
4. The pharmaceutical composition according to claim 3 for: (i) inhibition of angiogenesis; (ii) inhibition of vascular smooth muscle cell proliferation in disorders including atherosclerosis, hyperthrophic heart failure and postsurgical restenosis; (iii) inhibition of cell proliferation and migration in the treatment of primary tumors and metastasis; (iv) treatment of nonmalignant tumors such as benign prostate hyperthrophy; (v) treatment of diabetic retinopathy, psoriasis, rheumatoid arthritis, and other disorders including retrolental fibroplasia, macular degeneration, hemangioma, arteriovenous malformation, hypertrophic scars, acne, scleroderma and autoimmune diseases.
5. The pharmaceutical composition according to claim 2 for the treatment of bone and cartilage related disorders including inherited skeletal disorders, e.g. achondroplasia, dwarfism, craniosynostosis.
6. The pharmaceutical composition according to any one of claims 1-5 wherein the 5,10,15,20-tetraaryl- porphyrin has the formula:

wherein Ar<sub>1</sub> , Ar<sub>2</sub> , Ar<sub>3</sub> , and Ar<sub>4</sub> , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged, n is an integer from 2 to 4 and X is a pharmaceutically acceptable anion.

7. The pharmaceutical composition according to any one of claims 1-5 wherein the 5,10,15,20-triaryl- corrole has the formula:

wherein Ar<sub>1</sub> , Ar<sub>2</sub> , and Ar<sub>3</sub> , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged, n is an integer from 2 to 3 and X is a pharmaceutically acceptable anion.

8. The pharmaceutical composition according to claim 6 or 7, wherein said carboaryl radical by itself or as part of the mixed carboaryl-heteroaryl radical is a substituted monocyclic or bicyclic aromatic radical and said heteroaryl radical is a substituted 5-6 membered aromatic ring containing 1-3 heteroatoms selected from O, S and/or N.

9. The pharmaceutical composition according to claim 8, wherein said carboaryl radical is selected from phenyl, biphenyl and naphthyl substituted by one or more

radicals including, but not being limited to, halogen, alkyl, alkoxy, alkylamino, aminoalkylamino, and trialkylammonium.

10. The pharmaceutical composition according to claim 9, wherein said carboaryl radical is phenyl substituted by fluoro and optionally by tri(C<sub>1</sub>-C<sub>8</sub>)alkylammonium or amino(C<sub>1</sub>-C<sub>8</sub>)alkylamino.

11. The pharmaceutical composition according to claim 10, wherein one or two of said carboaryl radicals is pentafluorophenyl and/or 4-aminopropylamino-2,3,5,6-tetrafluorophenyl.

12. The pharmaceutical composition according to claim 10, wherein one to four of said carboaryl radicals is 4-trimethylammoniophenyl or 4-trimethylammonio-2,3,5,6-tetrafluorophenyl.

13. The pharmaceutical composition according to claim 8, wherein said heteroaryl radical by itself or as part of a mixed carboaryl-heteroaryl radical is selected from furyl, thienyl, pyrrolyl, imidazolyl, thiazolyl, pyridyl, pyrimidyl, triazinyl substituted by one or more radicals including, but not being limited to, halogen, alkyl, alkoxy, alkylamino, aminoalkylamino, and trialkylammonium.

14. The pharmaceutical composition according to claim 13, wherein said one to four of said heteroaryl radicals is N-(C<sub>1</sub>-C<sub>8</sub>)alkyl-pyridylum.

15. The pharmaceutical composition according to claim 14, wherein said radical is selected from 2-, 3- or 4-(N-methyl) pyridylum.

16. The pharmaceutical composition according to claim 6 or 7, wherein said mixed carboaryl-heteroaryl radical is 4-(N-methyl-2-pyridylum)-2,3,5,6-tetrafluorophenyl.

17. The pharmaceutical composition according to any one of claims 1-6, wherein said porphyrin compound is selected from one of the compounds herein designated P1, P5, P6, P7, P8, P9, P10, P15, P16, P17, P18, P19 and P20.

18. The pharmaceutical composition according to any one of claims 1-5 and 7, wherein said corrole compound is the compound herein designated P21.

19. The pharmaceutical composition according to claim 4 for inhibition of angiogenesis comprising the compound P1 or P21.

20. The pharmaceutical composition according to claim 4 for inhibition of vascular smooth muscle cell proliferation in postsurgical restenosis comprising the compound P1 or P20.

21. The pharmaceutical composition according to claim 4 for inhibition of cell proliferation and migration in the treatment of primary tumors and metastasis comprising a compound selected from the compounds P1, P5, P7, P20 and P21.
22. The pharmaceutical composition according to claim 5 for inhibition of FGFR-3 tyrosine kinase activity and treatment of achondroplasia, comprising the compound P16.
23. Use of a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, for the preparation of a pharmaceutical composition for inhibiting growth factor receptor tyrosine kinase (RTK) activity.
24. The use according to claim 23, wherein said growth factor RTK is selected from fibroblast growth factor (FGF) RTK, epidermal growth factor (EGF) RTK, platelet derived growth factor (PDGF) RTK, vascular endothelial growth factor (VEGF) RTK, nerve growth factor (VGF) RTK and hepatocyte growth factor (HGF) RTK, insulin RTK and insulin-like growth factor (IGF) RTK.
25. The use according to claim 24 for inhibition of cell proliferation mediated by growth factor RTK activity.
26. The use according to claim 25 for inhibition of angiogenesis.
27. The use according to claim 25 for inhibition of vascular smooth muscle cell proliferation in disorders including atherosclerosis, hyperthrophic heart failure and postsurgical restenosis.
28. The use according to claim 25 or 26, for inhibition of cell proliferation and migration in the treatment of primary tumors and metastasis.
29. The use according to claim 25 for treatment of nonmalignant tumors such as benign prostate hypertrophy.
30. The use according to claim 25 for treatment of diabetic retinopathy.
31. The use according to claim 25 for treatment of psoriasis.
32. The use according to claim 25 for treatment of rheumatoid arthritis.
33. The use according to claim 25 for treatment of disorders including retrolental fibroplasia, macular degeneration, hemangioma, arteriovenous malformation, hypertrophic scars, scleroderma and autoimmune diseases.

34. The use according to claim 24 for the treatment of bone and cartilage related disorders including inherited skeletal disorders e.g. achondroplasia, dwarfism, craniosynostosis.

35. The use according to any one of claims 23-34 wherein the 5,10,15,20-tetraaryl-porphyrin has the formula:

wherein  $Ar_1$ ,  $Ar_2$ ,  $Ar_3$ , and  $Ar_4$ , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged,  $n$  is an integer from 2 to 4 and  $X$  is a pharmaceutically acceptable anion.

36. The use according to any one of claims 23-34 wherein the 5,10,15,20-triaryl-corrole has the formula:

wherein  $Ar_1$ ,  $Ar_2$ , and  $Ar_3$ , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged,  $n$  is an integer from 2 to 3 and  $X$  is a pharmaceutically acceptable anion.

37. The use according to claim 35 or 36, wherein said carboaryl radical by itself or as part of the mixed carboaryl-heteroaryl radical is a substituted monocyclic or bicyclic aromatic radical and said heteroaryl radical is a substituted 5-6 membered aromatic ring containing 1-3 heteroatoms selected from O, S and/or N.

38. The use according to claim 37, wherein said carboaryl radical is selected from phenyl, biphenyl and naphthyl substituted by one or more radicals including, but not being limited to, halogen, alkyl, alkoxy, alkylamino, aminoalkylamino, and trialkylammonium.

39. The use according to claim 38, wherein said carboaryl radical is phenyl substituted by fluoro and optionally by tri(C<sub>1</sub>-C<sub>8</sub>)alkylammonium or amino(C<sub>1</sub>-C<sub>8</sub>)alkylamino.

40. The use according to claim 39, wherein one or two of said carboaryl radicals is pentafluorophenyl and/or 4-aminopropylamino-2,3,5,6-pentafluorophenyl.

41. The use according to claim 39, wherein one to four of said carboaryl radicals is 4-trimethylammoniophenyl or 4-trimethylammonio-2,3,5,6-pentafluorophenyl.

42. The use according to claim 37, wherein said heteroaryl radical by itself or as part of a mixed carboaryl-heteroaryl radical is selected from furyl, thienyl, pyrrolyl, imidazolyl, thiazolyl, pyridyl, pyrimidyl, triazinyl substituted by one or more radicals including, but not being limited to, halogen, alkyl, alkoxy, alkylamino, aminoalkylamino, and trialkylammonium.

43. The use according to claim 42, wherein said one to four of said heteroaryl radicals is N-(C<sub>1</sub>-C<sub>8</sub>)alkyl-pyridylum.

44. The use according to claim 43, wherein said radical is selected from 2-, 3- or 4-(N-methyl) pyridylum.

45. The use according to claim 35 or 36, wherein said mixed carboaryl-heteroaryl radical is 4-(N-methyl-2-pyridylum)-2,3,5,6-tetrafluoro-phenyl.

46. The use according to any one of claims 23-35, wherein said porphyrin compound is selected from one of the compounds herein designated P1, P5, P6, P7, P8, P9, P10, P15, P16, P17, P18, P19 and P20.

47. The use according to any one of claims 23-34 and 36, wherein said corrole compound is the compound herein designated P21.

48. A 5,10,15,20-tetraaryl-porphyrin of the formula:

wherein  $Ar_1$ ,  $Ar_2$ ,  $Ar_3$ , and  $Ar_4$ , the same or different, are each an aryl radical selected from a carboaryl, a heteroaryl and a mixed carboaryl-heteroaryl radical, at least two of said aryl radicals being positively charged,  $n$  is an integer from 2 to 4 and  $X$  is a pharmaceutically acceptable anion, and wherein at least one of the non-positively charged aryl radicals, if present, is pentafluorophenyl or 4-amino( $C_1$ - $C_8$ )alkylamino-2,3,5,6-tetrafluorophenyl, and at least two of the positively charged aryl radicals are  $N$ -( $C_1$ - $C_8$ )alkyl-pyridylium or 4-( $N$ - $C_1$ - $C_8$ alkyl-pyridylium)-2,3,5,6-tetrafluoro-phenyl.

49. The porphyrin of claim 48 being selected from one of the compounds herein designated **P16, P17, P18, P19 and P20**.

50. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a tetrapyrrolic macrocycle selected from a 5,10,15,20-tetraaryl-porphyrin according to claim 48 and a 5,10,15-triaryl-corrole, wherein said aryl radical of the corrole compound is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged.

51. A pharmaceutical composition according to claim 50 wherein the 5,10,15,20-tetraaryl-porphyrin according to claim 48 is one of the compounds herein designated **P16, P17, P18, P19 and P20**.

52. A pharmaceutical composition according to claim 50 wherein the 5,10,15-triaryl-corrole is a corrole as defined in any one of claims 7-16.

53. The pharmaceutical composition according to claim 52 wherein the 5,10,15-triaryl-corrole is the compound herein designated **P21**.

54. A method for inhibiting growth factor receptor tyrosine kinase (RTK) activity comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at

least two of said aryl radicals are positively charged, in an amount sufficient to inhibit growth factor receptor activity.

55. A method for inhibiting angiogenesis comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit angiogenesis.

56. A method for prevention of restenosis after percutaneous transluminal coronary angioplasty comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit smooth muscle cell proliferation.

57. A method for inhibiting primary tumor growth and metastasis comprising the administration of an inhibitor selected from a tetrapyrrolic macrocycle selected from 5,10,15,20-tetraaryl-porphyrin and 5,10,15-triaryl-corrole, wherein said aryl radical is a carboaryl, a heteroaryl or a mixed carboaryl-heteroaryl radical and at least two of said aryl radicals are positively charged, in an amount sufficient to inhibit primary tumor growth and metastasis.
